PRUDENCE MOHLALA

Data Analytics

Objective of Case Study

BrightTV's CEO aims to grow the company's subscription base for the current financial year. This analysis is conducted to support the Customer Value Management (CVM) team by providing data driven insights.

This presentation focuses on:
Analyzing user behavior and viewership trends
Identifying factors influencing content consumption
Recommending content strategies for low engagement periods
Proposing initiatives to grow the subscriber base

Most Watched Channels

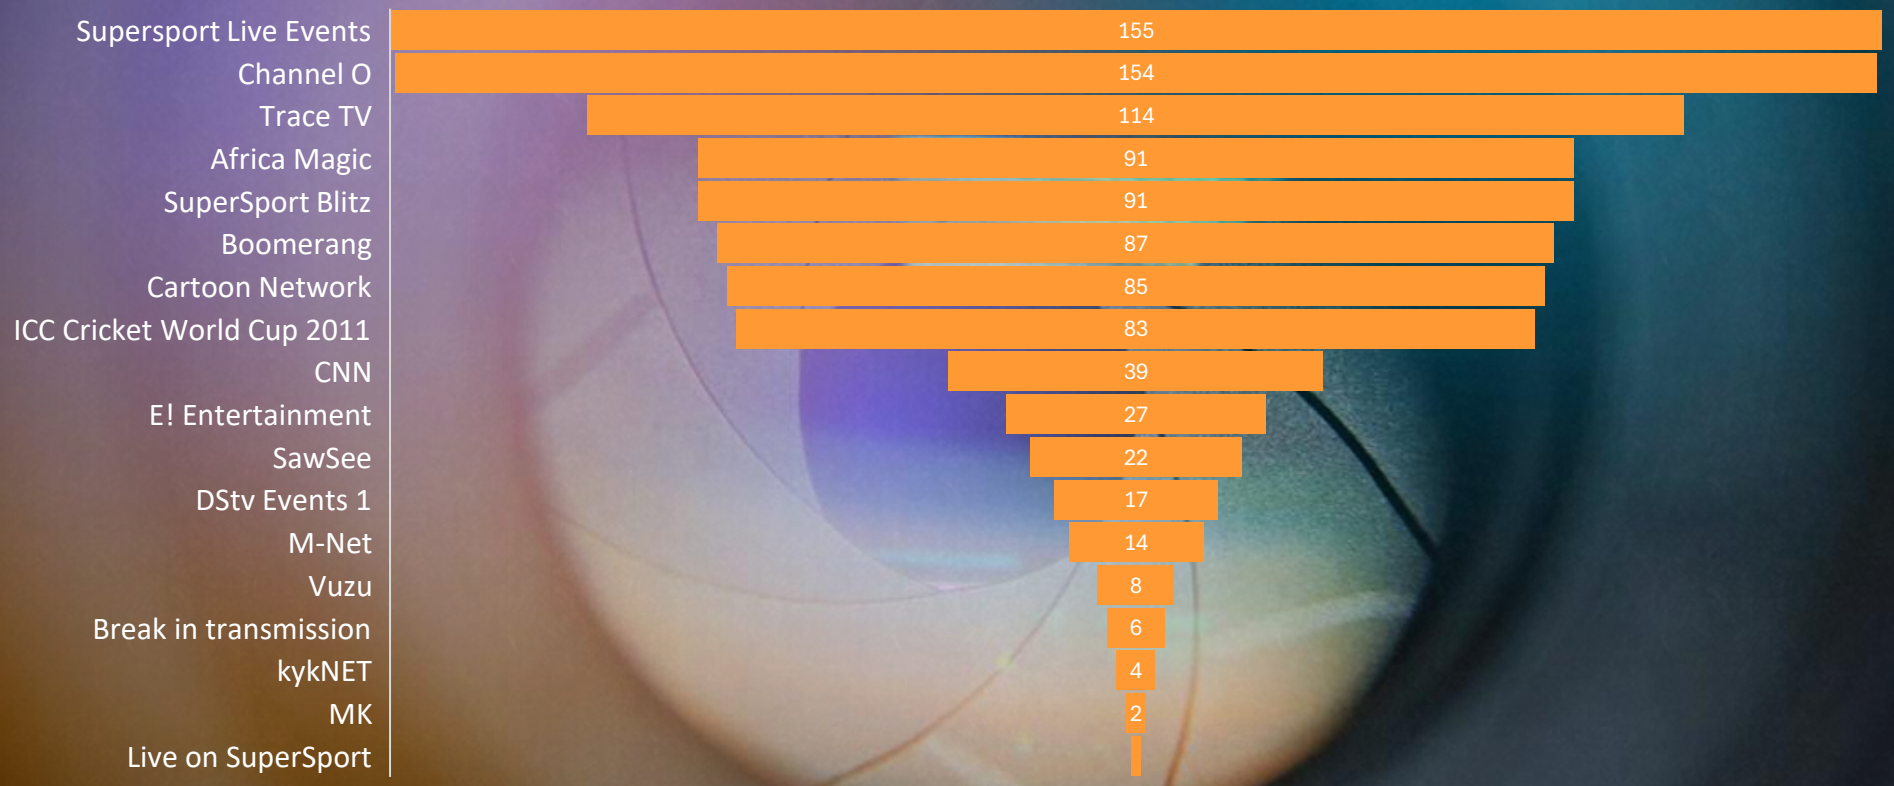

Figure 1:SuperSport Live Events, Channel O and Trace TV dominate viewership, followed by Africa Magic, SuperSport Blitz, Boomerang, Cartoon Network and CNN with steady engagement. Other channels perform lower overall, with MK and Live on SuperSport Channels having the least views.

The real time and entertainment driven content plays a significant role in driving user engagement on the platform

Viewership by Province

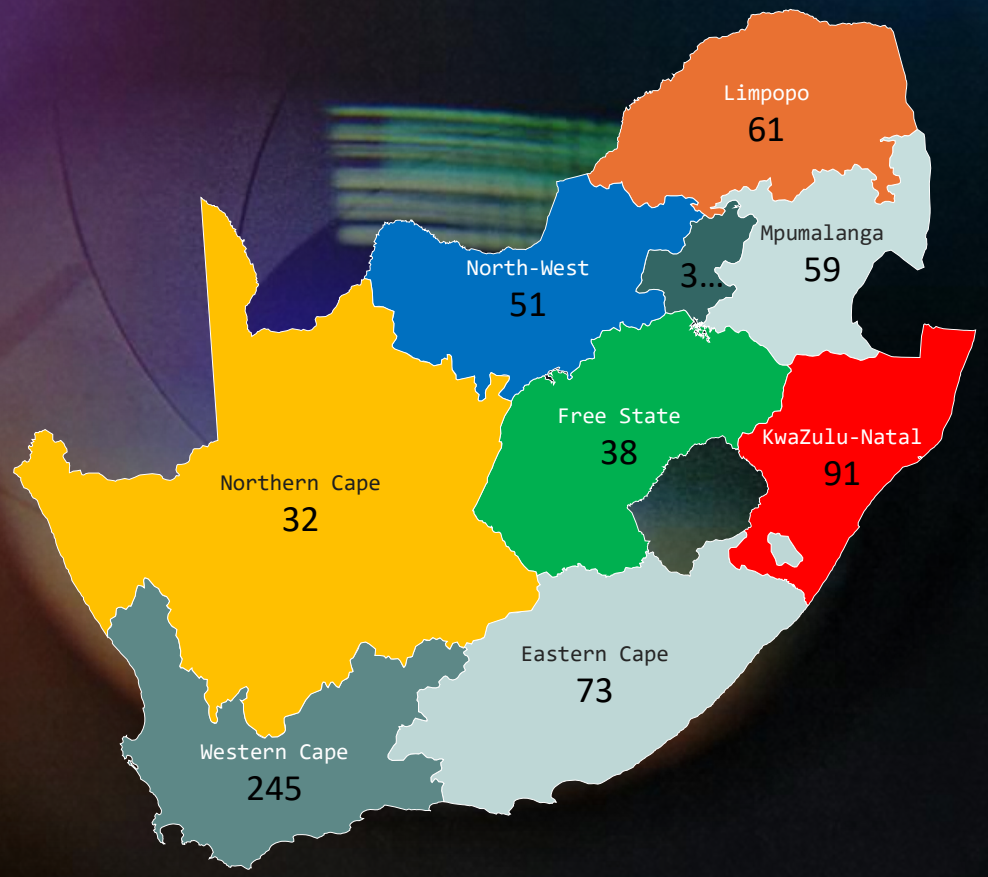

Figure 2: The filled map shows that Gauteng leads in viewership, which is expected given its high population density and economic opportunities that attract a large audience base.
The Western Cape follows with strong engagement, while other provinces contribute relatively lower viewership recording under 100 views.

This suggests that urbanized provinces drive the majority of platform engagement

Age Group Analysis

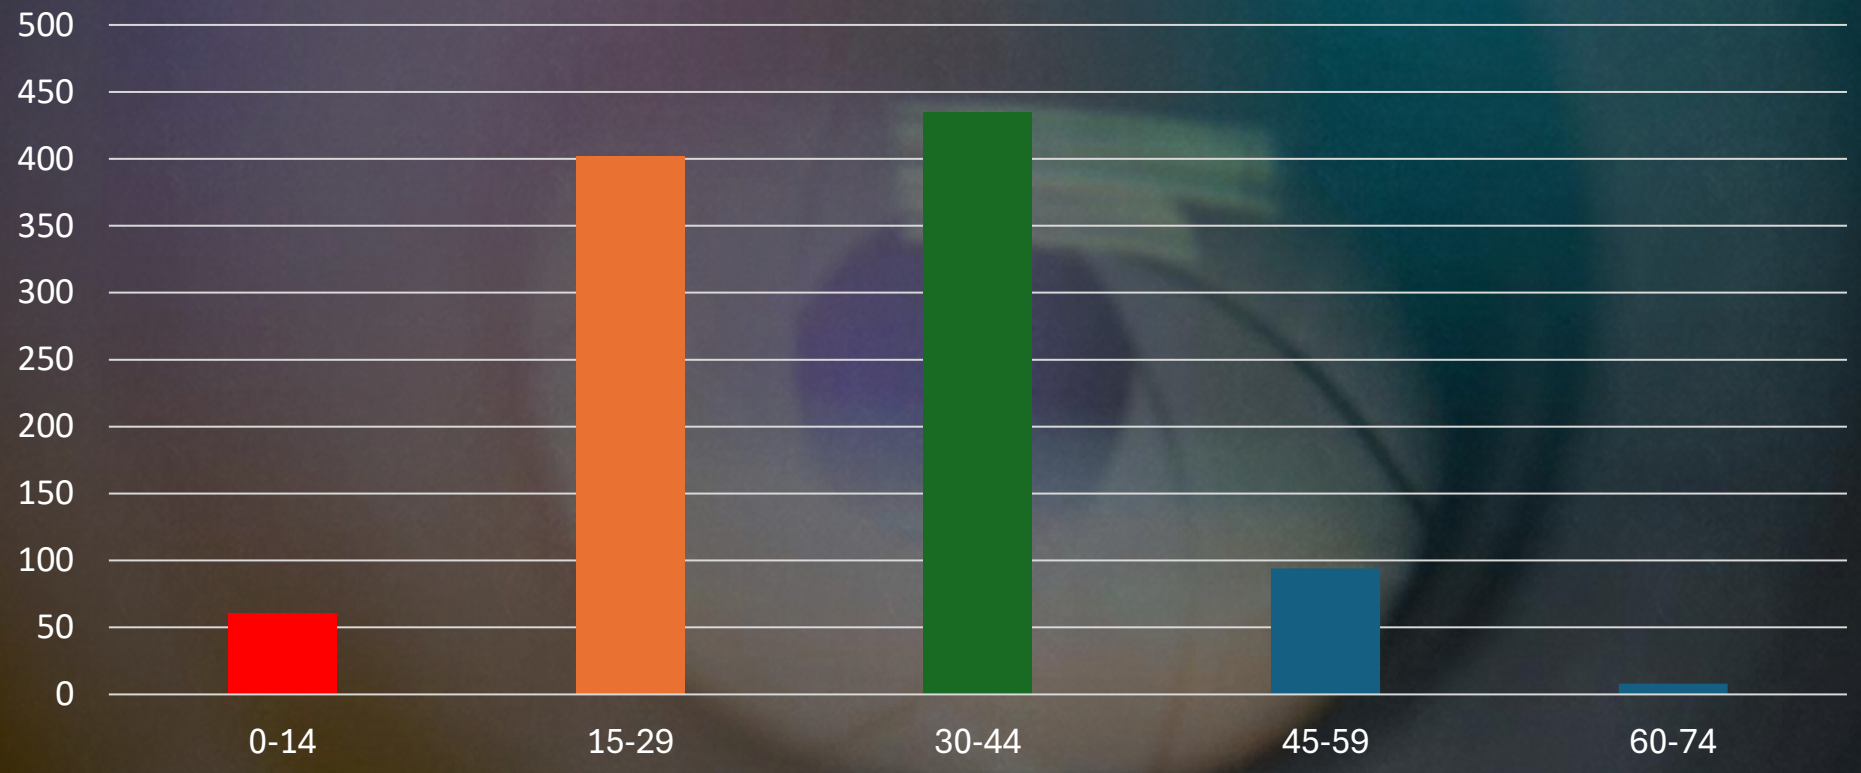

Figure 4: The data indicates that BrightTV's primary audience consists of working-age adults, particularly those between 30 and 44. This suggests that the platform is well positioned among economically active users.
However, lower engagement among older and younger segments highlights potential opportunities to diversify content and expand audience reach.

Time Bucket Analysis

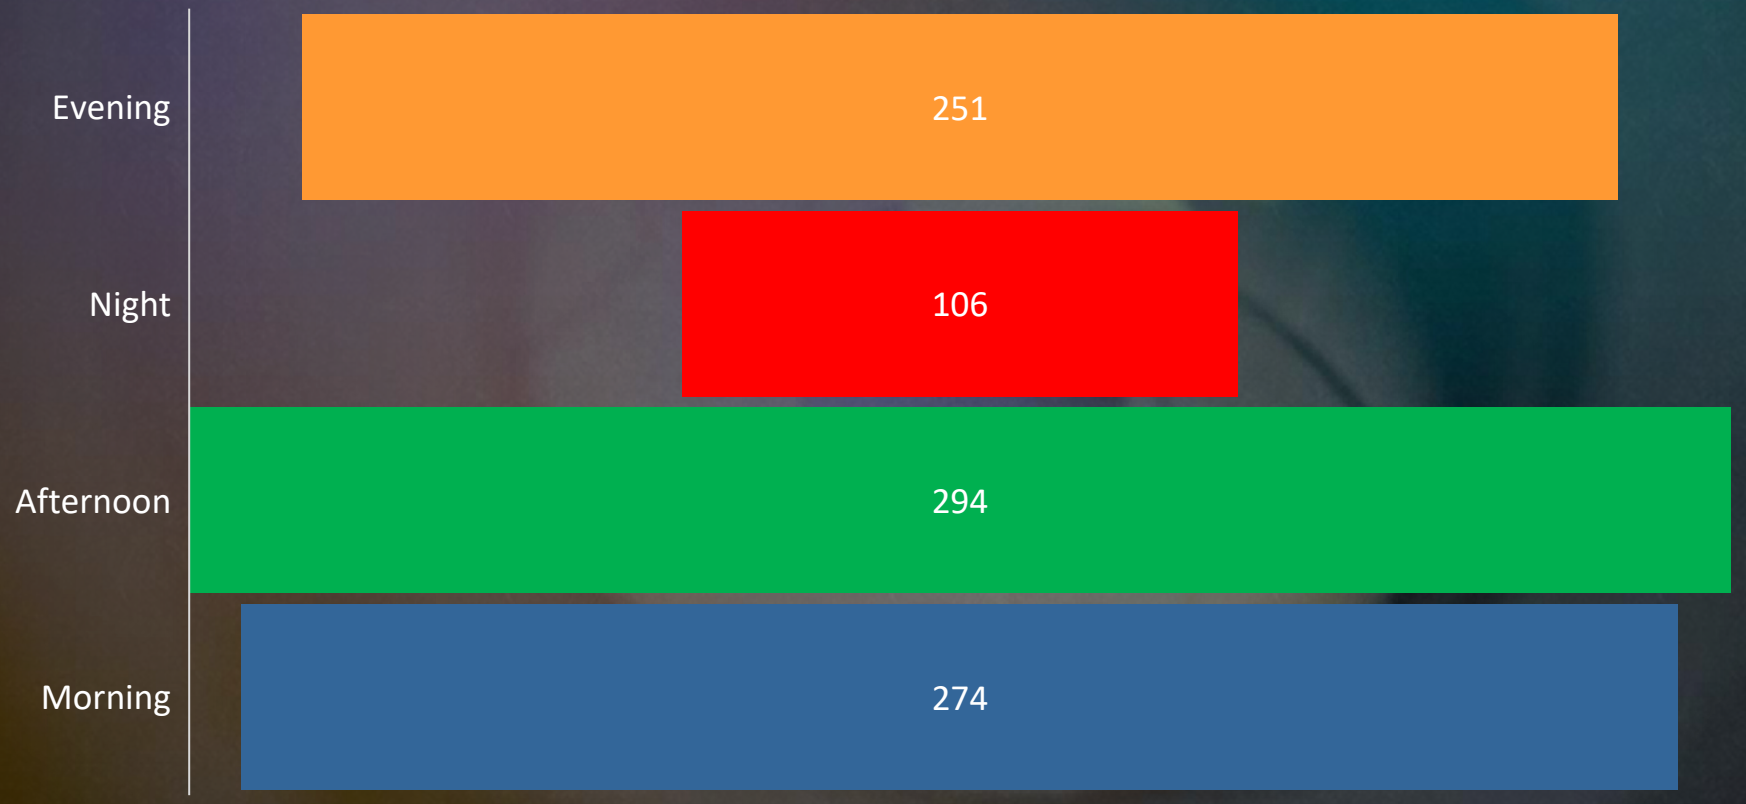

Figure 5: Interestingly, the data shows that afternoon is the peak viewing period, followed by morning and evening. Late-night viewership is the lowest. While this may seem unexpected, it suggests that users engage more during the day, possibly due to flexible schedules, mobile access, or background viewing during work or study hours.

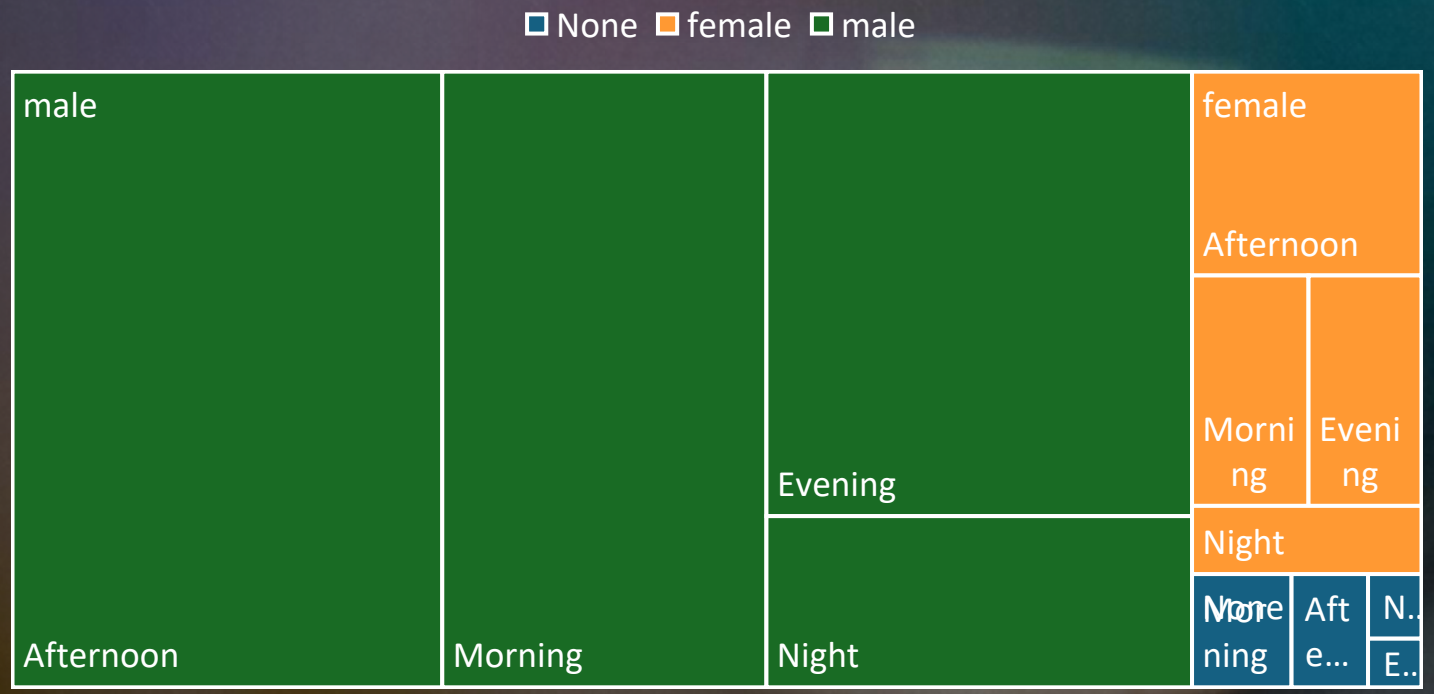
This reflects a shift to on-demand viewing, driven by the working-age audience identified earlier, who consume content more during the day than at night.

Viewership per Gender by Time Buckets



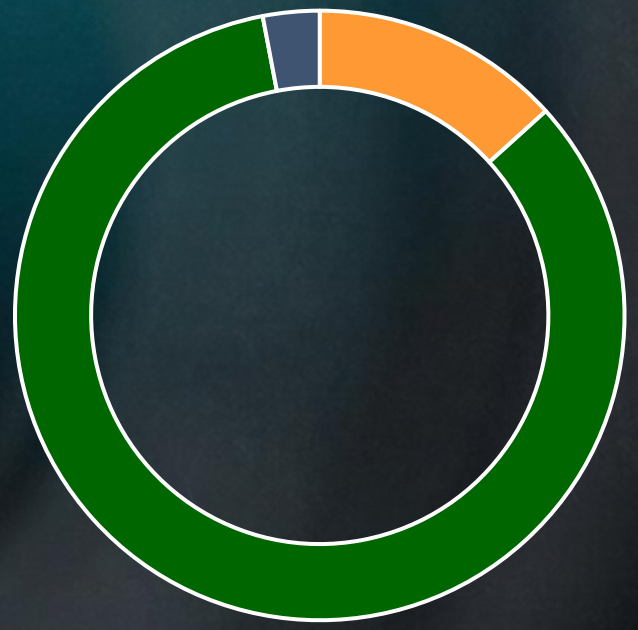


Figure 6: By combining gender distribution with time bucket viewing, we observe that male users dominate overall engagement, particularly during the afternoon, which is the peak viewing period. Female users display a more evenly distributed viewing pattern throughout the day, although their activity also peaks in the afternoon.

This suggests that while both groups follow similar viewing trends, the platform is currently more heavily utilized by male viewers.

Most Viewed channel by Race

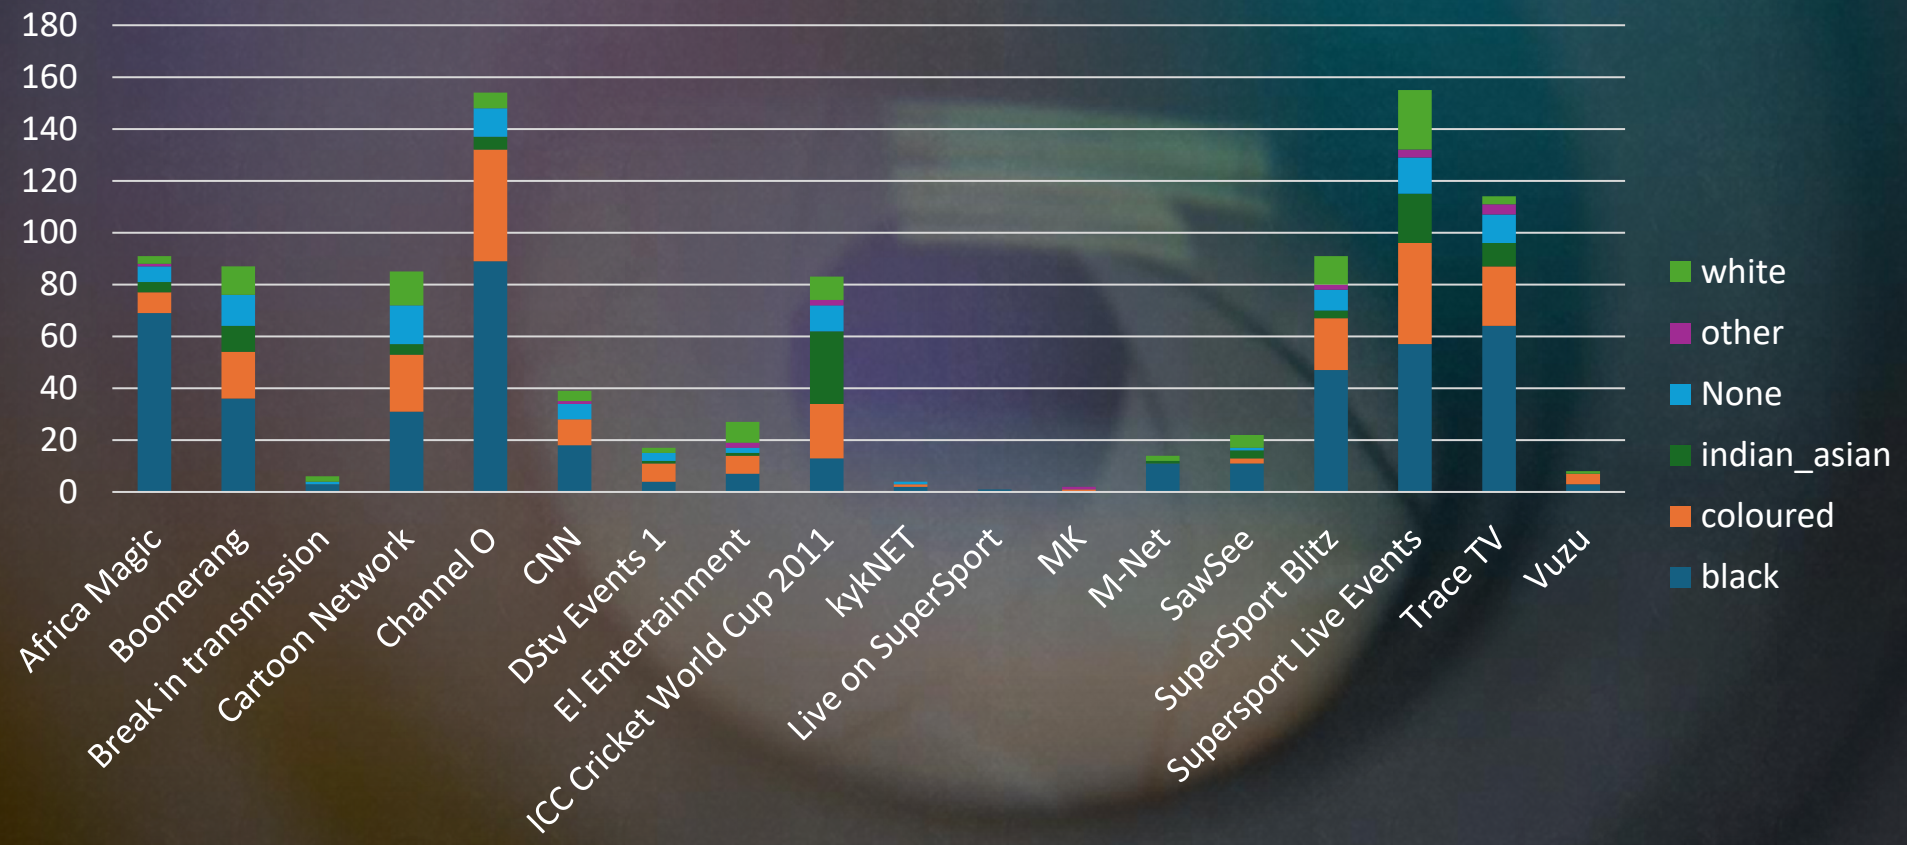

Figure 7: The analysis shows that Black viewers contribute the majority of viewership across most channels, followed by Coloured and White audiences. Content such as Channel O, SuperSport Live Events, and Trace TV performs strongly across these groups, suggesting a clear preference for music and live sports.
In addition, Indian and Asian audiences, while smaller in number, show relatively stronger engagement in sports content such as cricket.

Top 10 Most Engaging Users/Viewers

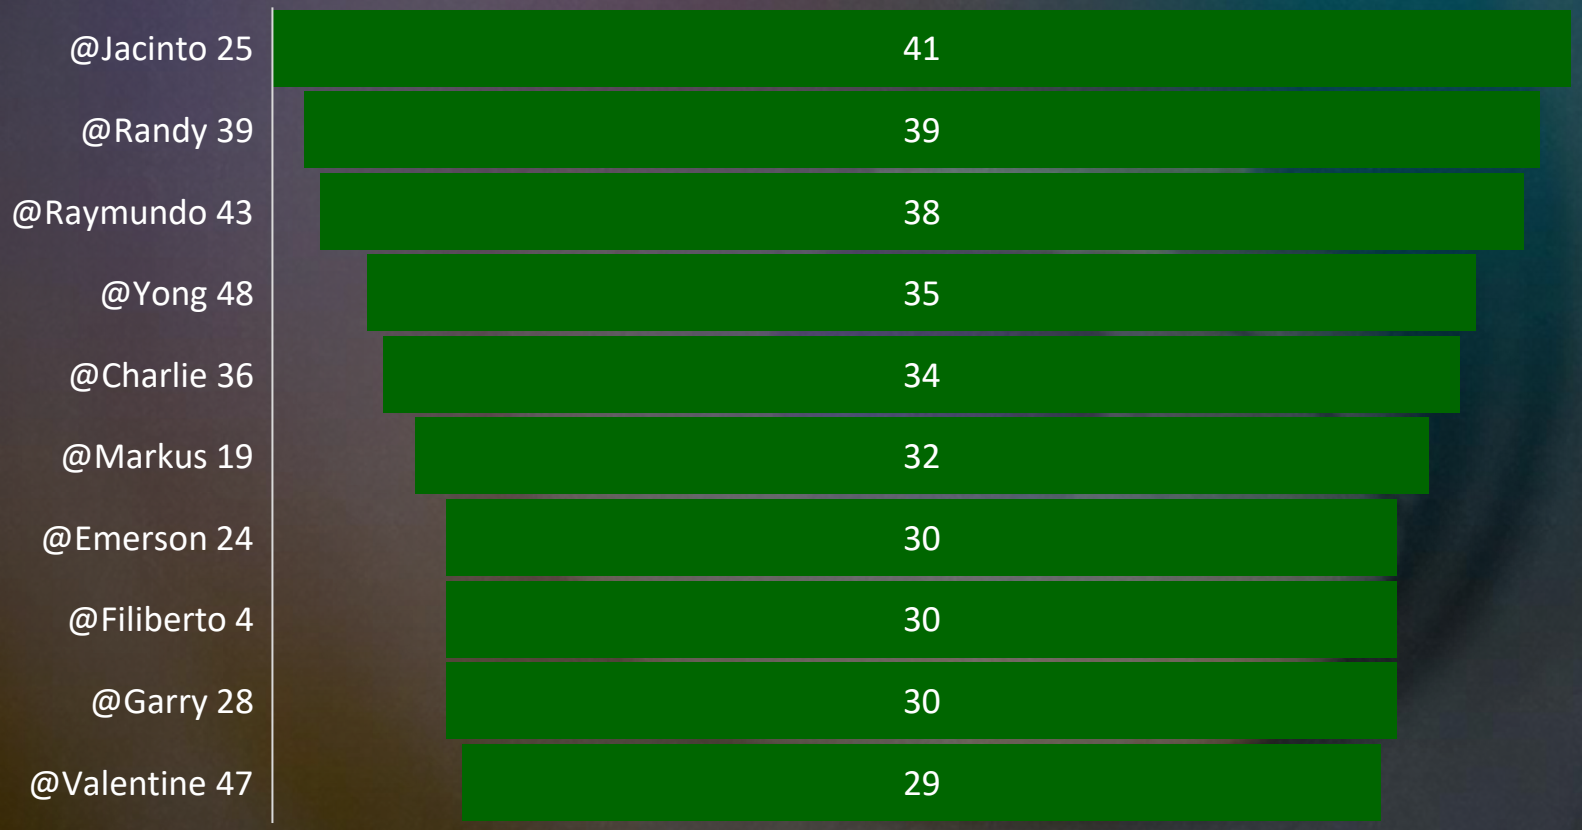

Figure 7: The top 10 users show significantly higher engagement compared to the rest of the user base, representing a High Customer Value Segment .
This presents an opportunity to leverage these highly active users as influencers to drive subscriptions and increase overall platform engagement.

Recommendations

Content Strategy
Expand SuperSport Live Events, Channel O, Trace TV, Africa Magic and SuperSport Blitz through more exclusive sports and real time entertainment rights to strengthen competitiveness.

Viewing Behaviour
Afternoon is peak usage. Improve personalised recommendations and optimize daytime content, with stronger morning and evening on demand offerings.

Audience Expansion
Core users are 30–44. Add music, gaming, and short-form content for younger users, and documentaries/news for older audiences (60–74+). Improve mobile accessibility.

Geographic Growth
Focus on Gauteng and Western Cape while expanding into low viewership provinces (<100 views) using localized content and partnerships.

Demographics
Male users dominate; Black viewers are the largest group. Maintain strong sports content and add lifestyle/family programming to improve female engagement.

High-Value Users
Top 10 users form a high-value segment. Leverage them as brand ambassadors and early adopters to drive organic growth.

Conclusion

BrightTV’s engagement is strongly shaped by live sports and real time entertainment, with a clear concentration among working age users and peak activity in the afternoon. This reflects a platform that is highly aligned with daytime, mobile first consumption behaviour.

Viewership is geographically concentrated in Gauteng, with the Western Cape emerging as a secondary growth hub, while other regions remain largely untapped.

A distinct High Customer Value Segment demonstrates that a small group of users contributes disproportionately to engagement, highlighting the importance of deepening relationships rather than only expanding reach.

Overall, the findings show a platform with strong core strengths but uneven distribution of engagement across time, geography, and user segments indicating that future growth will depend on balancing audience depth with broader market expansion.
